How does a photovoltaic cell work?

**Photovoltaic Cell Defined:** A photovoltaic cell, also known as a solar cell, is defined as a device that converts light into electricity using the photovoltaic effect. **Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor.

What determines the efficiency of a solar panel?

The efficiency of a solar panel--that is, its ability to convert sunlight into electricity--is determined by several factors, including the quality of the silicon used, the configuration of the solar cells, and the panel's exposure to sunlight. The silicon used in solar cells is the foundation of their efficiency.

What are the basic principles of photoelectric conversion?

**Fundamentals of photoelectric conversion:** charge excitation, conduction, separation, and collection. Lectures cover commercial and emerging photovoltaic technologies and cross-cutting themes, including conversion efficiencies, loss mechanisms, characterization, manufacturing, systems, reliability, life-cycle analysis, ...

What topics are covered in a photovoltaic lecture?

What is the photovoltaic effect?

The photovoltaic (PV) effect is more than just an interaction between sunlight and silicon. It's a complex interplay of physical and chemical processes that allow for the efficient conversion of light energy into electrical energy.

When were photovoltaic devices developed?

The most efficient photovoltaic devices were developed during the 1930s (Fig. 3). The first semiconductor p-n junction solar cells were described in 1941 by Russel Ohl of Bell Laboratories (Fig. 4).
