How do solar thermal power plants work?

Solar thermal power plants are electricity generation plants that utilize energy from the Sun to heat a fluid to a high temperature. This fluid then transfers its heat to water, which then becomes superheated steam. This steam is then used to turn turbines in a power plant, and this mechanical energy is converted into electricity by a generator.

What is a solar thermal power plant?

Solar thermal power plants usually have a large field, or array, of collectors that supply heat to a turbine and generator. Several solar thermal power facilities in the United States have two or more solar power plants with separate arrays and generators.

What are thermal energy storage applications in solar power plants?

Case studies of thermal energy storage applications in solar plants, buildings, and cold chain transportation are also presented. Solar power plants can generate electricity either directly using photovoltaic cells or indirectly using concentrated solar power that heats a liquid to power steam turbines.

What makes a solar thermal power plant an active system?

An active system requires some way to absorb and collect solar radiation and then store it. Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy.

What is solar thermal energy?

Solar thermal energy (STE) is a form of energy and a technology for harnessing solar energy to generate thermal energy for use in industry, and in the residential and commercial sectors. Solar thermal collectors are classified by the United States Energy Information Administration as low-, medium-, or high-temperature collectors.

Can solar thermal power plants provide electricity to 100 million people?

By concentrating solar energy with reflective materials and converting it into electricity, modern solar thermal power plants, if adopted today as an indispensable part of energy generation, may be capable of sourcing electricity to more than 100 million people in the next 20 years [source: Brakmann].
