

What is the stochastic bidding strategy of microgrid?

In this paper, a stochastic bidding strategy of microgrid in a joint day-ahead market of energy and spinning reserve service is proposed taking into account of uncertainty of renewable DG units' output power and load. The stochastic bidding strategy is modeled as bi-level optimization problem and can be divided into two steps.

Does microgrid bidding strategy take into account uncertainty in power market?

The bidding strategy of microgrid with consideration of uncertainty in power market has not been specially studied yet. Therefore, this paper focuses on the paradigm of microgrid participating in power market for providing energy and spinning reserve taking into account of uncertainty.

What are microgrid uncertain net power scenarios?

According to the microgrid uncertain power scenario model in Section 3.2, 1000 forecast error scenarios of wind power, photovoltaic power and load were generated and comprehensively calculated to obtain microgrid uncertain net power scenarios.

How do DR aggregators achieve the best bidding strategy?

In Ref. [29], a game theory method is used to achieve the best bidding strategy for DR aggregators. Each DR aggregator manages a large number of home subscribers through DR program. An incentive contract is concluded between each customer and the aggregator in exchange power for encouraging customers to participate in the DR program.

How is expected imbalance and operation cost calculated in microgrids?

The expected imbalance and operation cost is calculated by iteratively invoking lower level deterministic unit commitment under each microgrid uncertain net power scenario. The lower level deterministic unit commitment is coded and solved by mixed integer nonlinear programming (MINLP) solver DICOPT in GAMS.

This paper proposes a price-maker bidding and offering model for networked microgrids (NMG) in a pool-based day-ahead electricity market. The objective of this model is to maximize the net ...
