Are battery degradation studies based on real data?

Most battery degradation studies refer to modelled data without validating the models with real operational data, e.g. [10,12,17]. In this research, data from a BESS site in Herdecke (GER) operated by RWE Generation is used to analyse the degradation behaviour of a lithium-ion storage system with a capacity of 7.12 MWh.

Do operating strategy and temperature affect battery degradation?

The impact of operating strategy and temperature in different grid applications Degradation of an existing battery energy storage system (7.2 MW/7.12 MWh) modelled. Large spatial temperature gradients lead to differences in battery pack degradation. Day-ahead and intraday market applications result in fast battery degradation.

How much battery capacity does a home storage system lose per year?

The main scientific contributions of this paper are the development of a method to estimate the usable battery capacity of home storage systems and the publication of the large dataset. The key findings are that the measured HSSs in field operation lose about 2-3 percentage points (pp) of capacity per year.

What is a battery energy storage system (BESS)?

Day-ahead and intraday market applications result in fast battery degradation. Cooling system needs to be carefully designed according to the application. Battery energy storage systems (BESS) find increasing application in power grids to stabilise the grid frequency and time-shift renewable energy production.

What is the degradation of the battery operating in the FCR market?

The graph shows the degradation of the battery operating in the FCR market, the intraday market and the day-ahead market with two different SoC limitations: 5-95% and 20-80%. The FCR application is modelled only with the air-cooled temperature model (solid line). Since the BESS lifetime is already sufficient, we saw no need for further extension.

How do physical models of stress and degradation affect battery life?

Compared to experimentation, physical models of stress and degradation allow engineers to better understand the impacts of design concepts on battery lifetime to optimize the design process.
