What is a capacitive discharge ignition?

The capacitive-discharge ignition uses capacitor to discharge current to the ignition coil to fire the spark plugs. The history of the capacitor discharge ignition system can be traced back to the 1890s when it is believed that Nikola Tesla was the first to propose such an ignition system.

What are energy storage capacitors?

Capacitors exhibit exceptional power density, a vast operational temperature range, remarkable reliability, lightweight construction, and high efficiency, making them extensively utilized in the realm of energy storage. There exist two primary categories of energy storage capacitors: dielectric capacitors and supercapacitors.

Can a high-voltage capacitor discharge system extend spark plug life?

This paper describes a new electronic ignition system which provides trouble-free operation, while extending spark plug life to a warranted 50,000 miles or more. Design considerations are discussed that led to the development of a high-voltage capacitor discharge system whose performance justifies its premium cost.

How does a storage capacitor work?

The storage capacitor is charged either with a constant current or with pulses. Regardless of the method, the charging stage contains a small transformer which boosts the voltage level to approximately 400 volts in order to achieve the required stored energy results. At the ignition point the thyristor is triggered.

What are the advantages of a capacitor compared to other energy storage technologies?

Capacitors possess higher charging/discharging rates and faster response times compared with other energy storage technologies, effectively addressing issues related to discontinuous and uncontrollable renewable energy sources like wind and solar .

What is a capacitor & why is it important?

In either case, an important point is that the capacitor is storing energy that can be used. For example, if we attached a small LED bulb to the capacitor and closed the right and left switch, we would see a flash as the capacitor discharged, dumping its stored energy into the bulb.
