What is MPPT in solar inverter?

MPPT is the abbreviation of Maximum Power Point Tracking. As a vital function of the solar inverter, MPPT not only effectively raises the radiation utilization rate and maximizes the solar inverter's working efficiency but also converts voltage and currents output by modules to adjust their power according to sunlight intensity.

How to demonstrate the MPPT feature?

The main task is to demonstrate the MPPT feature. This is possible only if the solar panel is used as the power source. The solar panel must be placed in the exterior with good sun illumination. The inverter can work with the standard DC power supply used as the power source, instead of the solar panel.

Are MPPT controllers a good choice for solar panels?

Additionally, MPPT controllers offer the flexibility to use higher voltage solar panels with lower voltage batteries, a feature particularly useful in certain system designs. The optimized charging process facilitated by MPPT controllers also contributes to improved battery life.

Which solar panel is used for MPPT test?

A real solar panel with a nominal output power of 185 W was used for the MPPT test. The inverter runs on the maximum power point even if the illuminating conditions are widely changing. Standard bulbs were used as the load. The next test was the efficiency, and the output voltage measurement.

What type of converter does an MPPT controller use?

The power stage of an MPPT controller typically employs one of three converter types: buck, boost, or buck-boost (which includes SEPIC converters). Buck converters are efficient when the panel voltage is consistently higher than the battery voltage. Boost converters come into play when the panel voltage can dip below the battery voltage.

How many solar panels can a solar inverter power?

The nominal input voltage is 36 V DC. Therefore, one solar panel with an output voltage of 36 V, or two solar panels each of 18 V connected in series can be used as the power source for the inverter. For demonstration purposes, the nominal output power of the solar panels can vary from about 50 W up to 200 W per panel.
