Does airflow organization affect heat dissipation behavior of container energy storage system?

In this paper, the heat dissipation behavior of the thermal management system of the container energy storage system is investigated based on the fluid dynamics simulation method. The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures.

Does a PCM-assisted heat pipe provide heat dissipation performance?

They found that the PCM-assisted heat pipe provided up to 86.7% cooling load under a power range of 50-80 W. This paper aims to investigate heat dissipation performance of a multiple heat source system under constant and dynamic powers of the heat sources. Various PCMs are used to remove thermal energy from a heat pipe.

What is a thermal energy storage system?

Thermal energy storage (TES) systems provide a good solution to this issue. Latent heat thermal energy storage (LHTES) systems offer the possibility of storing higher amounts of energy per unit of storage material mass in comparison to sensible heat thermal energy storage (SHTES) systems.

How is heat dissipated under a transient high-power operation?

Generally, an increase of dissipated heat under a transient high-power operation of a heat source is fulfilled by increasing the power of the cooling fan. Most heat is dissipated by using forced air convection with and without a heat pipe in a periodic or a transient manner.

Does a microheat pipe array thermal management system affect battery operating temperature?

Mo (20) used experiments to verify the influence of a microheat pipe array thermal management system on the battery operating temperature and temperature difference. At a discharge rate of 3 C,  $T_{max}$  can be kept below 43.7 °C and  $\Delta T$  is below 4.9 °C. Zhao (21) developed a BTMS that combines heat pipes and wet cooling.

What is the container for the energy storage?

The container for the energy storage is a tank full of the PCMs. This container with dimensions of 106 mm × 31 mm × 23 mm was made from polylactide acid by a 3D printer, and it was covered by insulation materials to reduce the heat dissipation.
