

Design of photovoltaic panel auxiliary power generation products

What is portable auxiliary photovoltaic power system for electric vehicles?

It is innovative that the portable auxiliary photovoltaic power system for electric vehicles delivers electricity through WPT technology, which has the advantages of 1) satisfactory energy transfer efficiency and 2) no requirement of car modification. Design of PVPGM based on a foldable mechanism.

Can auxiliary photovoltaic power system extend the range of EVs?

An auxiliary photovoltaic system combined with WPT is proposed to use solar energy resources to extend the range of EVs while considering the portability and versatility of the photovoltaic system. The overall structure and working principle of the auxiliary photovoltaic power system for EVs are presented in Fig. 4.

Why do photovoltaic systems need auxiliary power supplies?

Photovoltaic systems are continually evolving to improve their efficiency and financial viability. One trend is to move to larger strings of cells giving higher dc voltages to be converted to ac voltage for the grid. Cost savings result but auxiliary power supplies for monitoring and control need to accept these higher voltages as inputs.

What is a photovoltaic power generation module?

The system includes a photovoltaic power generation module and an electricity transfer module. The photovoltaic power generation module built based on a foldable scissors mechanism is five times smaller than in its unfolded state, improving its portability in its folded state.

What is the prediction algorithm model of photovoltaic power generation power?

The prediction algorithm model of photovoltaic power generation power Solar energy is actually a gray system. In practice, there are many unstable situations that affect the output performance of solar power plants. In order to judge the power generation, the gray theory can be used to establish a model. The process is:

Can a photovoltaic power system supply electric vehicles?

An electric vehicle in Chengdu city was simulated for a case study. The results show that the annual output of a single photovoltaic power system can drive the MINIEV for 423.625 km, indicating that the proposed system would be able to supply power for electric vehicles as an auxiliary power supply system.
