What is a process flow of an ASU with energy storage?

A process flow of an ASU with energy storage utilizing the distillation potential of the ASU to absorb the released air due to storing energy (i.e.,the energy storage air) is proposed.

How do you calculate the exergy efficiency of a LAEs system?

In the ASU-ES-AESA, the exergy efficiency of the LAES system in the energy storage process is expressed as: (7) i exe, L A E S, s t = Ex 24 WASU - E S - A E S A, s t - W CASU where Ex 24 is the exergy output of liquid air in the energy storage process.

What are the exergy efficiencies for energy storage and release?

Its product exergy efficiencies for energy storage and release are 37.80 % and 37.57 %, respectively. The overall exergy efficiency of the LAES and the electrical round-trip efficiency of the proposed system are both 67.48 %, the electricity cost saving ratio is 6.43 %, and the payback period of the LAES is 2.4 years.

How a large-scale liquid air is stored during energy storage?

During energy storage, large-scale liquid air was stored by using an ASU. For the energy release process, the liquid air was recycled into the ASU in gaseous form instead of cold storage devices, so as to reduce the irreversible loss and economic investment arising from the cold/heat storage equipment.

What is the flow diagram of ASU-es-AESA in the energy storage process?

The process flow diagram of the ASU-ES-AESA in the energy storage process. The flow diagram of the energy release process for this ASU-ES-AESA is illustrated in Fig. 7. The LASU suspends operations. The stored liquid air (stream 52) is recycled in two states after being pressurized by a liquid air pump (LAP).

What is a cold exergy in a liquid air storage system?

For their LAES systems, the cold exergy of stored liquid air is introduced to reduce the input exergy of air liquefaction in the ASU during energy release, which can be regarded as an inverse process of liquid air storage, i.e. a process of exergy increase. However, for the conventional LAES, no cold exergy is input during energy release.
