Does airflow organization affect heat dissipation behavior of container energy storage system?

In this paper, the heat dissipation behavior of the thermal management system of the container energy storage system is investigated based on the fluid dynamics simulation method. The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures.

Why is air cooling a problem in energy storage systems?

Conferences & 2022 4th International Confer... With the energy density increase of energy storage systems (ESSs), air cooling, as a traditional cooling method, limps along due to low efficiency in heat dissipation and inability in maintaining cell temperature consistency. Liquid cooling is coming downstage.

How does airflow organization affect energy storage system performance?

The results of the effort show that poor airflow organization of the cooling air is a significant influencing factor leading to uneven internal cell temperatures. This ultimately seriously affects the lifetime and efficiency of the energy storage system.

Is temperature inhomogeneity a bottleneck for air-cooling systems?

In fact, the issue of temperature inhomogeneity has been an important factor limiting the development of energy storage systems based on air cooling for thermal management. The barrel effect becomes a bottleneck for air-cooled designs. To overcome these shortcomings, scholars have made some efforts in the improvement of air-cooling systems.

What is energy storage system (ESS)?

The energy storage system (ESS) studied in this paper is a 1200 mm × 1780 mm × 950 mm container, which consists of 14 battery packs connected in series and arranged in two columns in the inner part of the battery container, as shown in Fig. 1. Fig. 1. Energy storage system layout.

How to improve airflow in energy storage system?

The aim of this strategy is to improve the fan state at the top so that the entire internal airflow of the energy storage system is in a circular state with the central suction and the two blowing ends. Optimized solution 4: fans 3 and 9 are set to suction state and the rest of the fans are set to blow state.
