What are the different types of thermal energy storage containers?

Guo et al. [19]studied different types of containers,namely,shell-and-tube,encapsulated,direct contact and detachable and sorptive type,for mobile thermal energy storage applications. In shell-and-tube type container,heat transfer fluid passes through tube side,whereas shell side contains the PCM.

What are the characteristics of energy storage materials?

Material properties should be stableeven after extended thermal cycles of heating and cooling. Chemical stability: High chemical stability of storage materials increases life of energy storage plant. Volume change: For phase change materials, change in volume during phase change process should be minimal.

Which materials are used in thermal energy storage?

In high temperature side, inorganic materials like nitrate salts are the most used thermal energy storage materials, while on the lower and medium side organic materials like commercial paraffin are most used. Improving thermal conductivity of thermal energy storage materials is a major focus area.

Can a PCM container be used as a cold thermal energy storage system?

Appl Therm Eng 141 (June):928-938 Ghahramani Zarajabad O, Ahmadi R (2018) Employment of finned PCM container in a household refrigerator as a cold thermal energy storage system. Thermal Sci Eng Progress 7:115-124

How can thermal energy storage materials be encapsulated?

The considered thermal energy storage materials were encapsulated in a cylindrical copper tubeand was placed between the glass cover and absorber plate. The combination of paraffin wax and granular carbon powder was observed to attain a thermal efficiency of 78.31%.

What are the properties of solar thermal energy storage materials?
