What are insulation resistance and dielectric withstand voltage?

Insulation resistance and dielectric withstand voltage are particularly crucial parameters for ensuring both safety and reliability during end-user operation. This article aims to explain the test methods for evaluating the insulation resistance and dielectric withstand voltage of the NTCRP series.

Does SAMTEC perform insulation resistance & dielectric withstand voltage?

That's shocking! Insulation Resistance and Dielectric Withstanding Voltage are two of the qualification tests that Samtec performs in-house during part qualification testing.

Do I need a dielectric voltage withstand test?

However, even in cases where a device complies with the defined through-air and over-surface spacing requirements, the overall insulation system must be tested by the application of the dielectric voltage withstand test to the insulation system.

What is insulation resistance test?

The purpose of the Insulation Resistance (IR) test is to determine the resistance of the insulation materials to leakage of current. This is measured on the surface while DC potential is applied at 500 VDC.

How does a test voltage break down a insulating material?

Simply stated, the test voltage breaks down the insulating properties of the material. The mechanism of dielectric breakdown begins with the application of a strong electric field to the insulating material by a high voltage. Different materials require different levels of electric field in order for dielectric breakdown to occur.

How to measure creepage distance of EHV insulators?

Table 1 Creepage distance of (extra high voltage) EHV insulators. In other test method, paper tape and flexible measuring tape is used, as tools for the determination of the creepage length of the disc insulators.
