

Can fuel cells and photovoltaic panels be used as primary energy sources?

Scientific Reports 14, Article number: 27621 (2024) Cite this article This paper proposes a new energy management system to combine Fuel Cells (FC) and photovoltaic (PV) panels as primary power sources. Also, battery and Super Capacitor (SC) banks are considered as secondary energy systems.

Can a fuel cell provide operational support to photovoltaic (PV) modules?

Rahman and Tam studied the feasibility of applying fuel cell (FC) to provide operational support to photovoltaic (PV) modules. The authors demonstrated here that the combination of FC and PV could be used to meet variable loads for either utility or stand-alone applications.

Can a photovoltaic generator be integrated with a fuel cell?

Abstract: as the power generated by a Photovoltaic (PV) system is affected by the weather conditions, there must be storage units to store and deliver energy as per customer needs. One of the potential solutions to this issue is the integration of the PV generator with electrolytic hydrogen and fuel cell (FC).

What is solar PV based DC-DC boost converter with electric vehicle?

Solar PV-based DC-DC boost converter with electric vehicle . The PV car is a clean-energy vehicle with the obvious advantage of providing clean propulsion power with zero emissions and improved energy usage [20,21]. Simultaneously, power semiconductors with higher-rated blocking voltages must be used, resulting in lower conduction losses.

Can a fuel cell solve the intermittent nature of PV energy systems?

The operation of the fuel cell is simulated and analyzed using Matlab/Simulink where many of the encountered problems were solved. The simulation results of the proposed system prove that it can efficiently solve the intermittent nature of the PV energy systems while preserving the environment.

What is the role of PV modules in generating electricity?

It was also concluded that the PV modules contributed largely for the power production followed by fuel cell for the scenario 1. For scenario 2, the PV modules were followed by the biogas generator in terms of electricity generation. The Hydrogen tank capacity was 5000 kgs for low and medium consumers while that of high consumers was 25,000 kgs.
