

# Flywheel energy storage system design diagram

What is flywheel energy storage system (fess)?

Flywheel energy storage system (FESS) is an electromechanical system that stores energy in the form of kinetic energy. A mass coupled with electric machine rotates on two magnetic bearings to decrease friction at high speed. The flywheel and electric machine are placed in a vacuum to reduce wind friction.

What are the components of a flywheel energy storage system?

A flywheel energy storage system consists of bearings, a rotating mass, a motor-generator, and a frequency inverter. Fig. 14.4 shows the main components of a flywheel energy storage system. The design of the components influences the overall efficiency, and can help in reducing power transmission losses.

How efficient is a flywheel energy storage system?

Their efficiency is high during energy storage and energy transfer (>90 %). The performance of flywheel energy storage systems operating in magnetic bearing and vacuum is high. Flywheel energy storage systems have a long working life if periodically maintained (>25 years).

What are the potential applications of flywheel technology?

Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

How does a flywheel store energy?

The flywheel stores energy by spinning at high speeds and releases it when needed by converting kinetic energy into electrical energy. A power electronic converter is the link between the flywheel motor and the power supply system. The kinetic energy stored in the flywheel is presented in Eq. (1).

Are flywheel energy storage facilities suitable for continuous charging and discharging?

The energy storage facility provided by flywheels are suitable for continuous charging and discharging options without any dependency on the age of the storage system. The important aspect to be taken note of in this regard is the ability of FES to provide inertia and frequency regulation.

Featured Application: This article covers the design and operation of a low-cost test rig as a strategic tool to aid the development of burst containments for flywheel energy ...

Energy storage flywheel systems are mechanical devices that typically utilize an electrical machine (motor/generator unit) to convert electrical energy in mechanical energy and vice versa. Energy is stored in a fast-rotating mass ...
