How does the energy storage model work?

The model optimizes the power and energy capacities of the energy storage technology in question and power system operations, including renewable curtailment and the operation of generators and energy storage.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Can energy storage be integrated into the grid?

Integrating energy storage into the grid can have different environmental and economic impacts, which depend on performance requirements, location, and characteristics of the energy storage system 14, 15, 16. The cost of energy storage systems and regulatory challenges are major obstacles to their adoption 13, 17, 18, 19.

Can energy storage be economically viable?

We also consider the impact of a CO<sub>2</sub> tax of up to \$200 per ton. Our analysis of the cost reductions that are necessary to make energy storage economically viable expands upon the work of Braff et al. 20, who examine the combined use of energy storage with wind and solar generation assuming small marginal penetrations of these technologies.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.
