

Generator room air supply and exhaust specifications

How should a generator room be designed?

The generator room should have sufficient air circulation to exhaust heat and fuel exhaust. The exhaust chambers should be integrated into the generator design, and the air ducts should be designed to ensure that no gas or air can infiltrate the generator room.

How should a generator room be ventilated?

Make sure to put all necessary components of a successful ventilation system into place, including air intake and outlet vents, fans, and air ducts. Browse Used Generators By making sure your generator room is properly ventilated, you can keep things running smoothly and prevent dangerous accidents.

Do generator rooms need air purging?

Generator rooms tend to be in need of air purging as buildup of engine exhaust and other output can be dangerous. Air ventilation systems can also play a role in generator noise reduction. By installing insulated air ducts and using smart layout in regards to where air inlet and outlet locations are, noise levels can be controlled.

Where should exhaust air be sourced for a generator?

For generators with remote radiators, it is recommended that the exhaust air should be sourced as high as possible and directly above the generator sets. Significant bypass of ventilation airflow directly into the discharge airflow will lead to reduction in cooling effectiveness and elevated temperatures within the room.

What are the design parameters of a generator?

Generator-room temperature, ventilation airflow, ventilation air cleanliness, and air movement are critical design parameters that must be analyzed during the design process to ensure optimal and reliable operation of the generator set. It is critical that an adequate amount of ventilation airflow be delivered to the generator room.

Who designs and installs a generator exhaust system?

The proper design and functionality of a generator exhaust system falls on the responsibility of the engineering firm of record. If a field fabricated system is being utilized, the design and installation of the system must be a collaboration between the engineering firm and the installing contractor.
