Are switched reluctance generators suitable for wind energy conversion?

Switched reluctance generators (SRGs) are suitable candidates for wind energy conversion systems, as they present a simple structure, robustness, a wide range of speed and are capable of operating in harsh environments. The machine, however, poses challenges such as high torque ripple, acoustic noise production and highly nonlinear behavior.

What is a switch permanent magnet generator?

As a pioneer, we challenged the wind industry first by making PMGs the preferred technology for offshore wind turbines and then making them commercially available to onshore turbines. The Switch permanent magnet generators increase annual energy production, minimize total life cycle costs, and fulfill the strictest grid code requirements.

How do wind generators contribute to grid voltage stability?

Wind generators are required to contribute to grid voltage stability by providing reactive power support and maintaining voltage within acceptable limits<sup>53</sup>. Wind generators are expected to remain connected and operational during short-term grid disturbances, such as short-circuit faults.

Which type of wind generator is best?

Among the classes of wind generators, PMSG is the most popular in full-variable speed wind energy conversion systems (WECS) due to: (i) high-power density and reliability, (ii) no need for excitation and gearbox, and (iii) low rotor losses and high efficiency.

Do DFIG-based wind turbines have a combined vector and direct power control?

A combined vector and direct power control for DFIG-based wind turbines. IEEE Trans. Sustain. Energy 5, 767-775 (2014). Zhang, Y., Hu, J. & Zhu, J. Three-vectors-based predictive direct power control of the doubly fed induction generator for wind energy applications.

How can a wind generation system be regulated?

One approach involves operating the wind generation system with power reserve, achieved by shifting the MPPT reference. In this approach, the pitch angle can be regulated based on frequency deviations, enabling power reserves to participate in primary frequency control<sup>156</sup>.
