

Generator with low air inlet temperature

What are the requirements for a gas turbine inlet temperature regulator?

The gas turbine inlet temperature regulator has strict requirements for the resistance of the air flow outside the tube. Generally, the operating resistance is required to be controlled below 150 Pa, which requires that the air flow speed should not be too high.

Does changing turbine inlet temperature increase net power?

For this purpose, based on the energy, exergy, environmental, and economic (4E) analyses, the effects of changing turbine inlet temperature (TIT) on a gas turbine power plant in northeastern Iran were studied. The results showed that increasing TIT enhanced net power and efficiency, so that increasing TIT about 10 K enhanced net power by 1.7%.

How much power does a thermoelectric generator produce?

Shock invented a thermoelectric generator as waste heat recovery systems in class 8 truck applications and the output power can reach 255 W (hot and cold side temperature are about 600 K and 300 K, respectively). There have been few reports on the TEG systems with a power over 1 kW at low temperatures.

What is a gas turbine inlet air-cooling system?

The gas turbine inlet air-cooling system has been analysed in detail by Bies et al. . A schematic of the system integrated in a gas turbine is presented in Fig. 1. The system consists of two parts: A direct contact air-cooler. A specially designed LiBr absorption chiller capable of producing chilled water at temperatures as low as 2 °C. Fig. 1.

What is a thermoelectric generator (TEG)?

Such a power generation system has been designed and built using thermoelectric generator (TEG) modules. Experiments have been conducted to measure the output power at different conditions: different inlet temperature and temperature differences between hot and cold sides. TEG modules manufactured with different materials have also been tested.

What causes interior temperature difference in a thermoelectric generator?

Kim derived a model describing the interior temperature difference as a function of the load current of a thermoelectric generator (TEG) and the results showed approximately 25% of the maximum output power is lost because of the parasitic thermal resistance of the TE module used in the experiment.

At 18:24 in Table 1, the ambient temperature was reported to be 82 °F. In this example, the maximum allowable top tank temperature is 230 °F. To find the ambient capability of this ...

For example, an enterprise uses deep well water (16 degrees in summer and 14 degrees in winter) to reduce the inlet air temperature, so that the inlet air temperature of the diesel generator unit is generally 25 degrees
