

Which technologies are considered for optimal sizing microgrid configuration?

Diverse RE technologies such as photovoltaic (PV) systems, biomass, batteries, wind turbines, and converters are considered for system configuration to obtain this goal. Net present cost (NPC) is this study's objective function for optimal sizing microgrid configuration.

Why is urban governance a major limitation in microgrid planning?

Urban governance, rooted in the Capability Approach pioneered by the Nobel laureate Amartya Sen, emphasizes equity and resilience, especially during disasters [2, 26, 27]. Furthermore, a major limitation in contemporary microgrid planning is the concentration of numerous critical services within individual microgrids [17].

Do socioeconomic factors affect urban microgrid planning?

However, disregarding socioeconomic factors in defining microgrid boundaries risks perpetuating inequalities and impeding progress towards other SDG 11 targets, including fair democratic participation. Our approach integrates social and technical indicators to bolster urban microgrid planning.

Can renewable-powered microgrids electrify remote isolated areas?

A comprehensive evaluation framework was presented using HOMER for implementing renewable-powered Microgrids to electrify remote isolated areas, spanning various climatic zones, and accommodating future grid expansions (Kazmi et al. 2024).
