

How does the energy storage system regulate frequency

Does battery energy storage participate in system frequency regulation?

Combining the characteristics of slow response, stable power increase of thermal power units, and fast response of battery energy storage, this paper proposes a strategy for battery energy storage to participate in system frequency regulation together with thermal power units.

Why is energy storage system important?

Energy storage systems give power to the different loads when there is a shortage of power supply from the grid so that the stability of the power system is maintained due to its fast response. If the frequency severely deviates from the standard frequency, then many of the instruments connected to the power system can be damaged.

What is the frequency regulation control framework for battery energy storage?

(3) The frequency regulation control framework for battery energy storage combined with thermal power units is constructed to improve the frequency response of new power systems including energy storage systems. The remainder of this paper is organized as follows.

How does energy storage work?

The energy storage system anticipates upward/downward regulation by injecting/absorbing power into/from the system, much like the fast traditional generation plants that are maintained to update supply PFR by increasing/decreasing their output power in under/over frequency situations.

Does energy storage regulate system frequency?

Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control. According to Ref. [1], the shifting relationship between the energy reserve of energy storage and the kinetic energy of the rotor of a synchronous generator defines the virtual inertia of energy storage.

Can large-scale battery energy storage systems participate in system frequency regulation?

In the end, a control framework for large-scale battery energy storage systems jointly with thermal power units to participate in system frequency regulation is constructed, and the proposed frequency regulation strategy is studied and analyzed in the EPRI-36 node model.
