What is a microgrid cost model?

The National Renewable Energy Laboratory was commissioned by the U.S. Department of Energy to complete a microgrid cost study and develop a microgrid cost model. The goal of this study is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

How much does a solar microgrid cost?

The cost of a solar microgrid depends on many factors, including the size and location of the system. Solar microgrids range in size from a few kilowatts to several megawatts. A typical residential solar microgrid might cost around \$20,000, while a commercial-scale system could cost millions of dollars.

How much does energy storage cost a microgrid?

In commercial and industrial microgrids, energy storage represents 15% and 25% of the total costs per megawatt, respectively. In commercial microgrids, soft costs account for 43%, while in community microgrids they account for 24%.

How much does a microgrid cost per megawatt?

The community microgrid market has a mean cost of \$2.1 million per megawatt of DERs installed.

Does a microgrid control system cost more?

The control system for the smaller microgrid will likely cost less in real dollars but consume more of the overall project budget than the control system for the larger one. "Your control system may be a little less [costly] in smaller ones, but it's going to be a much larger portion of the cost than in the larger one.

What is the DOE's microgrid cost study?

The U.S. Department of Energy's (DOE's) microgrid cost study is identifying the costs of components, integration, and installation of U.S. microgrids; project cost improvements; and technical accelerators during the next 5 years and beyond.
