

How to find out if the photovoltaic panel is not connected properly

What should I do if my solar panel is not working?

Before picking up the phone to call for solar panel maintenance ("Hello, my solar panels are not working...") you can perform a few quick checks to further diagnose the issue: See if a circuit breaker tripped on your electrical panel. Restart your inverter, as this can sometimes clear out any faults in the system.

How can I diagnose a fault in my solar system?

To diagnose a fault in your solar system, first, reboot the charge controller by disconnecting it from the battery and solar panel. Use a multimeter to check your solar system's voltage - conduct the open-circuit voltage and short-circuit current tests. Identifying inverter issues is common since these devices aren't as resilient as the solar panels.

How do I know if my solar panel is bad?

Solar panel fault-finding guide including examples and how to inspect and troubleshoot poorly performing solar systems. Common issues include solar cells shaded by dirt, leaves or mould. Check all isolators are all on, and the circuit breakers have not tripped off. Check the grid voltage on the inverter display or app for over-voltage issues.

What happens if a solar panel is not connected?

When a solar panel is not connected, but still it is exposed to solar radiation, it will continue to produce electricity. This extra electricity can lead to overheating and cause the voltage across the panel to be converted into heat. This can potentially lead to a fire hazard if solar panels are not regularly checked and maintained.

Why isn't my solar panel working?

This problem is likely due to one of the following: A damaged solar panel can't absorb sunlight and convert it to solar energy. Faulty inverter: A solar inverter converts DC (direct current) power from the PV system to AC (alternating current) electricity.

How do I know if my solar system is working?

Check the solar system performance data on the app and website, if available. Check the solar panels for dirt, leaves, mould, or shade issues. Check the solar inverter for any warnings or faults. Check that the isolators are all on and that the circuit breakers have not tripped off.
