Where should high voltage conductors be confined?

High Voltage: All conductors on which high voltage may be present should be confined within grounded or properly insulated enclosures. Instrumentation cabinets containing high voltage conductors should have safety interlocks on access doors.

What should a technician know before opening a mixed voltage cabinet?

As a technician or engineer begins work on electronic controls it is natural to maintain a narrow focus on the suspect low voltage equipment and controls and easily forget that work inside of a mixed voltage cabinet exposes workers to dangerous voltages and short-circuit currents. Before opening the cabinet door: Know the voltage levels present.

Should bare conductors at high voltage be enclosed in grounded safety enclosures?

If confinement of high voltage is not possible, then bare conductors at high voltage must be enclosed within grounded safety enclosures with working interlocks. Except by deliberate breach of the enclosure, contact with bare conductors at high voltage should be impossible without tripping the interlock.

How do you prevent high voltage equipment from contaminating?

The best way to prevent this from happening is twofold. First, prevent the contamination from getting into the equipment in the first place. Use filters on fan and ventilation openings and don't let dust accumulate around the equipment. Second, open up and clean high voltage equipment on a regular basis.

Can a battery shelf contact a wall?

Energy storage system modules, battery cabinets, racks, or trays are permitted to contact adjacent walls or structures, provided that the battery shelf has a free air space for not less than 90 percent of its length.

How many volts can a dwelling unit energy storage system handle?

For dwelling units, an ESS cannot exceed 100 volts between conductors or to ground. An exception dictates that where live parts are not accessible during routine ESS maintenance, voltage exceeding 100 volts is permitted at the dwelling unit energy storage system. This information can be found at 706.30 (A).

"Danger -- High Voltage" signs warn that high-voltage equipment is enclosed inside and buried underground. Don't take chances -- contact the owner of the power system before you start ...
