

Inlet and exhaust design of generator set

What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

What is the intake system of a diesel generator set?

The intake system of the diesel generator set is equipped with dry air filter and air filter and air resistance indicator, with exhaust gas turbocharger, full intake and guaranteed performance.

Does diesel generator set have exhaust muffler?

Therefore, each diesel engine should use a separate exhaust system. If the exhaust system of diesel generator set needs to add exhaust muffler, the muffler should be reasonably selected and installed to minimize the back pressure of exhaust system caused by muffler installation. How to check the intake system of diesel generator set?

How to choose a diesel generator intake pipe?

Diesel intake pipes for diesel generator set should be avoided as far as possible and the number of bends should be reduced, or use a large arc transition. The inner diameter of the intake pipe should not be less than 200mm, and the inner wall of the pipe should be smooth without soldering slag particles.

What psi should a generator fuel inlet be?

lized with oversized utility delivery piping. As a final test to determine if an adequate fuel supply is provided to the engine, the fuel delivery pressure at the engine fuel inlet should vary less than 1.0 psi when the generator set is loaded to 100%. An analog pressure gauge should be installed at the engine fuel inlet to assist with th

What happens if multiple diesel generators are installed together?

When several diesel generators are installed together, some problems may arise if a general external exhaust pipe is used. When several diesel generating units are working at different times, condensate water produced by diesel engine exhaust will enter the non-working diesel engine and will easily damage the diesel engine parts.
