What are the island microgrids?

Table 1. Summary of the island microgrids. Recently, three unique stand-alone microgrid projects have been built at Dongfushan Island, Nanji Island, and Beiji Island in the east China, with an aim to replace diesel with renewable energy to improve renewable energy utilization, enhance power supply reliability, and reduce power supply cost.

Are island microgrids a viable solution?

Island microgrid (IM) systems offer a promising solution; however, optimal planning considering diverse components and alternatives remains challenging. Using China's Yongxing Island as a case study, we propose a novel indicator system integrating economic, resilience, energy, and environmental dimensions.

What technologies are used in Island microgrids?

Key technologies such as control technology and energy management for island microgrids are studied. Renewable energy penetration is discussed for the design and operation of island microgrids. The operation data for a year of the three island microgrids are analyzed from various aspects.

Do Island microgrids work in the East China Sea?

Three representative island microgrids in the East China Sea are demonstrated. Key technologies such as control technology and energy management for island microgrids are studied. Renewable energy penetration is discussed for the design and operation of island microgrids.

How many island microgrids are there for one year?

The operation data of the three island microgrids for one year are discussed in this section. Specifically, the analysis of Dongfushan Island, Nanji Island, and Beiji Island is based on the yearly operation data of 2012, 2015, and 2015, respectively. Fig. 17 shows the detailed monthly data of the three island microgrids.

Which island microgrids are based on yearly operation data?

Specifically, the analysis of Dongfushan Island, Nanji Island, and Beiji Island is based on the yearly operation data of 2012, 2015, and 2015, respectively. Fig. 17 shows the detailed monthly data of the three island microgrids. The PV generation on Beiji Island is split into two parts, PV-actual and PV-other, as shown in Fig. 17 (c).
