

# Microgrid Protection Overview

Are microgrids a threat to protection systems?

While microgrids have many benefits for power systems, they cause many challenges, especially in protection systems. This paper presents a comprehensive review of protection systems with the penetration of microgrids in the distribution network.

How to protect a microgrid with a communication network?

References [42,44] proposed the protection of a microgrid with a communication network using digital relays. These methods use differential protection for low fault currents, such as in an HIF and inverter-based-microgrid. In Reference [45], a communication-assisted OC protection scheme was proposed for PV in DC microgrids.

Why is microgrid protection important?

However, it has several operational challenges such as power quality, power system instability, reliability, and protection issues. Microgrid protection strategy is a prime issue for the reliable operation of the microgrid. The microgrid protection scheme must meet the essential conditions for grid-connected and islanded operational modes.

Do microgrid protection schemes meet operational requirements?

The microgrid protection scheme must meet the essential conditions for grid-connected and islanded operational modes. This paper presents a comprehensive review and comparative analysis of protection schemes and their implementation challenges for different microgrid architectures with various operational requirements.

How can a microgrid protect against a fault?

Al-Nasseri and Redfern presented a new type of protection scheme for microgrids based on the harmonics content of the inverter output voltage. Their method can protect against faults that are both internal and external to the protection zone. The method uses the Fourier transform (FFT) and THD.

What is microgrid control?

It makes decisions for market participation and coordination with the upstream network. The microgrid control includes voltage and frequency regulation, real and reactive power control, load forecasting and scheduling, microgrid monitoring, protection and black start.
