

New Energy Microgrid Construction Plan

Will the energy grid become a grid of microgrids?

Some energy futurists see the grid eventually becoming a grid of microgrids. For now, the concept of connecting microgrids is still in its infancy. The most notable is a project underway by Commonwealth Edison in the Bronzeville area of Chicago. The project featured here, a community being developed by KB Home, is also worth watching.

What is a microgrid strategy?

The Strategy development process began with microgrid experts deliberating on areas the Strategy should focus on for impactful results in key metrics, such as reliability, resilience, decarbonization, and affordability, in the next five to ten years.

What is a microgrid project?

The primary goal for microgrid projects is to increase the energy resilience and enhance the ability to serve an installation's electrical loads during a contingency situation.

Can microgrids improve energy resilience?

Since microgrids are not the only way to enhance energy resilience, communities may want to consider alternate resilience investment options, including hardening existing transmission and distribution systems, weatherizing power generation sources, and building additional distribution systems to provide energy supply redundancy.

How does government support microgrids?

Support for microgrids comes from research and development (R&D) programs at federal and state levels, software and tools, grants and funding support to incentivize demonstration projects, and tax and financial incentives for the installation of distributed energy [2, 3, 6, 126].

How much electricity will a microgrid generate?

The microgrid will generate the equivalent of 2,386 average U.S. homes' annual electricity use. The clean energy technology aligns with the Port Authority's aggressive sustainability goals, which include reaching net-zero emissions by 2050 and 100% zero-carbon electricity by 2040.

Some researchers propose that each microgrid in a future multi-microgrid network act as a virtual power plant - i.e. as a single aggregated distributed energy resource - with ...

The 12-megawatt microgrid will include 6.63 megawatts of rooftop solar, 3.84 megawatts of fuel cells, and 1.5 megawatts / 3.34 megawatt-hours of battery energy storage. It will also recover heat from the fuel cells to generate chilled ...
