Are microgrids a good investment?

Microgrids that incorporate renewable energy resources can have environmental benefits in terms of reduced greenhouse gas emissions and air pollutants. In some cases, microgrids can sell power back to the grid during normal operations. Depending on the complexity, microgrids can have high upfront capital costs.

How much energy does a Maryland microgrid produce a year?

The Maryland microgrids will produce approximately 3.3 million kWh of solar energy each year, and 7.4 million kWh hours of combined heat and power, saving energy by using waste heat from on-site power generation.

Are microgrids sustainable?

While examining the sustainability of a microgrid, it is best that all costs and benefits that microgrids incur and bring are considered. It has been suggested that investment in a microgrid can result in manifold benefits, such as enhanced energy efficiency and integrated renewable power generation.

Why do microgrids need more power?

This is because the increase in the upper limit of power and thermal power interaction between microgrids has increased the space for energy sharing between microgrids, and the local consumption capacity of the microgrid group has been improved, thereby reducing the power purchase and load shedding of each microgrid from power system.

What is integrated energy microgrid?

The integrated energy microgrid includes wind turbines (WT), solar thermal power stations (PVT), gas turbines (CHP), heat pumps (HP), electrical energy storage (ES), and thermal energy storage (HS). Loads include electricity and heat load, and loads can be adjusted to a certain extent--electricity and heat comprehensive demand response.

Does electricity price affect the microgrid's economic performance?

This study assumes a constant (not time-varying) electricity price in the NPV calculation. Despite the rising popularity of real-time pricing and time-of-use pricing, such impact on the microgrid's economic performance is outside the scope of this study.
