

Electrochemical energy conversion and storage systems are presently playing a lead role in the global energy platform. This study reports the fabrication of a Hydroelectric Cell (HEC) via the ...

The oxygen-deficient material has the intrinsic property of splitting water. It produces electricity by utilising the dissociated  $H^+$  /  $OH^-$  ions on the oxygen-deficient surface of ...

Here, we present oxygen-deficient black  $ZrO_{2-x}$  as a new material for sunlight absorption with a low band gap around  $\sim 1.5$  eV, via a controlled magnesiothermic reduction in 5%  $H_2/Ar$  from ...

The as-prepared black  $ZrO_{2-x}$  exhibited excellent optical absorption capability, a small band gap (2.09 eV for direct and 1.67 eV for indirect), and a reduced conduction band energy, which is ...

The photocatalytic activities of  $TiO_2$  have been limited mainly to absorbing in the ultraviolet spectrum which accounts for only 5% of solar radiation. High energy band gap and ...

The solar absorption becomes increasingly stronger with the heat treatment temperature. 1200  $^\circ C$  is an appropriate treatment temperature for oxygen-deficient  $TiO_2$  ...

Abstract. Owing to their nonemissive characteristics, electrochromic materials promise distinct advantages in developing next-generation eye-friendly information displays. Yet, it remains a ...

The solar absorption becomes increasingly stronger with the heat treatment temperature. 1200  $^\circ C$  is an appropriate treatment temperature for oxygen-deficient  $TiO_2$  according to X-ray ...

The crystalline protection layer provides high-density structure and enhances stability, and at the same time oxygen defects allow the carrier transport with low resistance as ...

Facile synthesis of oxygen-deficient  $MoO_{3-x}$  nanosheets by light radiation for fast electrochromic supercapacitors. ... and directly display the energy state in real time to the ...

Here, we present oxygen-deficient black  $ZrO_{2-x}$  as a new material for sunlight absorption with a low band gap around  $\sim 1.5$  eV, via a controlled magnesiothermic reduction in 5%  $H_2 / Ar$  from ...
