What are the parameters of a PV inverter?

Aside from the operating voltage range, another main parameter is the start-up voltage. It is the lowest acceptable voltage that is needed for the inverter to kick on. Each inverter has a minimum input voltage value that cannot trigger the inverter to operate if the PV voltage is lower than what is listed in the specification sheet.

What parameters should be considered when stringing an inverter and PV array?

Both the maximum voltage value and operating voltage range of an inverter are two main parameters that should be taken into account when stringing the inverter and PV array. PV designers should choose the PV array maximum voltage in order not to exceed the maximum input voltage of the inverter.

What are the input specifications of a solar inverter?

The input specifications of an inverter concern the DC power originating from the solar panels and how effectively the inverter can handle it. The maximum DC input voltage is all about the peak voltage the inverter can handle from the connected panels. The value resonates with the safety limit for the inverter.

What is the difference between PV array voltage and inverter voltage?

These numbers are your inverter's maximum input voltage and your PV array voltage. Your PV array voltage is the total voltage of all of your modules when connected in a series. The more modules connected in series, the higher your array voltage. This is important because the more modules you have, the more power you can generate.

What is inverter efficiency?

Inverter efficiency is discussed in EME 812 (11.5. Efficiency of Inverters). Depending on the topology, most modern inverters have built-in MPP trackers to insure maximum power is extracted from the PV array. Each inverter comes with a voltage range that allows it to track the maximum power of the PV array.

When can an inverter output at a rated power?

Normally, the inverter can output at its rated power when the external ambient temperature is below 45 degrees Celsius. When the ambient temperature exceeds 45 degrees, the inverter will reduce its load and may eventually stop operating to prevent overheating.
