Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What is phase change energy storage?

Phase change energy storage combined cooling, heating and power system constructed. Optimized in two respects: system structure and operation strategy. The system design is optimized based on GA + BP neural network algorithm. Full-load operation strategy has good economic, energy and environmental benefits.

What is a box-type phase change energy storage?

Box-type phase change energy storage thermal reservoir phase change materials have high energy storage density; the amount of heat stored in the same volume can be 5-15 times that of water, and the volume can also be 3-10 times smaller than that of ordinary water in the same thermal energy storage case.

Can phase change energy storage improve energy performance of residential buildings?

This study presents a phase change energy storage CCHP system developed to improve the economic, environmental and energy performance of residential buildings in five climate zones in China. A full-load operation strategy is implemented considering that the existing operation strategy is susceptible to the mismatch of thermoelectric loads.

What is the economic optimization metric for phase change energy storage?

This study selects the ATCSR as the main economic optimization metric for the CCHP system with phase change energy storage. The ATCSR is characterized as the ratio of the annual total cost difference between the SP system and the phase change energy storage CCHP system to the annual total cost of the SP system, as stated in .
