

Can photovoltaic-energy storage-integrated charging stations improve green and low-carbon energy supply systems?

In this study, an evaluation framework for retrofitting traditional electric vehicle charging stations (EVCSs) into photovoltaic-energy storage-integrated charging stations (PV-ES-I CSs) to improve green and low-carbon energy supply systems is proposed.

What is a photovoltaic-energy storage-integrated charging station (PV-es-I CS)?

As shown in Fig. 1, a photovoltaic-energy storage-integrated charging station (PV-ES-I CS) is a novel component of renewable energy charging infrastructure that combines distributed PV, battery energy storage systems, and EV charging systems.

How reliable is a PV plant with energy storage?

The PV plant with energy storage has excellent economic performance and poor reliability, and the system with only a battery and that with only the TES can achieve an LCOE of less than 0.155 USD/kWh.

What is the capacity optimization model of integrated photovoltaic-energy storage-charging station?

The capacity optimization model of the integrated photovoltaic-energy storage-charging station was built. The case study bases on the data of 21 charging stations in Beijing. The construction of the integrated charging station shows the maximum economic and environment benefit in hospital and minimum in residential.

Can a PV array improve the reliability of a solar power plant?

With the PV array, the integration of the CSP system can improve reliability most economically. The solar power plant comprising a PV array, CSP, TES, and battery achieved excellent reliability but the worst economic performance.

Does a PV plant have an energy-storage system?

The PV plant with an energy-storage system has a preeminent economic performance and poor reliability. In contrast to the current scenarios, the PV plant with only the integrated battery has superior economic performance than that with only the incorporated TES for the same value of LPSP.
