

Does PV generation participate in the FR of a microgrid system?

For the typical control of PV generation, PV generation works in the MPPT mode and does not participate in the FR of the microgrid system. V dc D C/A Microgrid

Can two-stage PV generation provide frequency support for Island microgrids?

This paper introduces a novel VSG control for two-stage PV generation to provide frequency support for island microgrids. Based on the similarities of the synchronous generator power-angle characteristic curve and the PV array P-V characteristic curve, PV voltage  $V_{pv}$  can be analogized to the power angle  $\delta$ .

Can a virtual synchronous generator control a microgrid without energy storage?

Abstract: In autonomous microgrids frequency regulation (FR) is a critical issue, especially with a high level of penetration of the photovoltaic (PV) generation. In this study, a novel virtual synchronous generator (VSG) control for PV generation was introduced to provide frequency support without energy storage.

Can a PV system co-regulate microgrid frequency with DU and battery storage unit?

From the simulation results of the two cases, through the proposed VSG, the PV system can better and more smoothly co-regulate microgrid frequency with DU and the battery storage unit. It improves both the frequency peak (or nadir) and steady frequency. (a) System frequency (b) Active power output of the DU

Is PV array voltage self-generated?

is self-generated. The power angle  $\delta$  is replaced with PV voltage  $V_{pv}$ , which renders PV array voltage directly response to grid frequency variation and generate a "natural" inertial behavior that output power automatically increase or decrease. It can better mimic the inertia behavior of SG.

Are microgrids a cost-effective solution for distributed generation integration?

Microgrids are emerging as a cost-effective solution for the integration of distributed generations (DGs) in the recent decades. However, considering the high penetration of DGs, the microgrid is an electrical system having a low inertia and a lack of FR.
