What are the trends in photovoltaic efficiency improvement?

Trends in photovoltaic (PV) efficiency improvement include incremental advances, the emergence of tandem solar cells stacking multiple materials for enhanced efficiency, the growing prominence of perovskite solar cells due to rapid efficiency gains, and the increasing popularity of bifacial solar panels capturing sunlight from both sides.

How many PV panels are in a PV array?

A PV array can be composed of as few as two PV panels to hundreds of PV panels. The number of PV panels connected in a PV array determines the amount of electricity the array can generate. PV cells generate direct current (DC) electricity. DC electricity can be used to charge batteries that power devices that use DC electricity.

What are new photovoltaic technologies?

Solar cell researchers at NREL and elsewhere are also pursuing many new photovoltaic technologies--such as solar cells made from organic materials, quantum dots, and hybrid organic-inorganic materials (also known as perovskites). These next-generation technologies may offer lower costs, greater ease of manufacture, or other benefits.

What are PV modules & arrays?

Modules can be used individually, or several can be connected to form arrays. One or more arrays is then connected to the electrical grid as part of a complete PV system. Because of this modular structure, PV systems can be built to meet almost any electric power need, small or large. PV modules and arrays are just one part of a PV system.

Why are PV modules cheaper than cell MSPs?

The relative price differences among the different PV technologies are less pronounced for module MSPs than for cell MSPs, because the higher-efficiency technologies require less module material per watt. Assumptions include manufacturing of 72-cell modules in urban China, not including tariffs.

What is a third type of photovoltaic technology?

A third type of photovoltaic technology is named after the elements that compose them. III-V solar cells are mainly constructed from elements in Group III--e.g., gallium and indium--and Group V--e.g., arsenic and antimony--of the periodic table. These solar cells are generally much more expensive to manufacture than other technologies.
