

How do you attach solar panels to a roof?

To attach a solar PV system, you first use rails and mounts made of aluminum. Then, the system is secured to the roof by penetrating the roofing material and securing the system feet using lag bolts. The bolts are sunk into the rafters.

Should a PV array be attached to a standing seam metal roof?

If an array is to be attached to a standing seam metal roof that is yet to be installed, the loads on the PV panels and roof panels, and the load path from the PV panels to the concealed clips, should be considered.

What is a flat roof ballasted racking system?

Flat roofs are often found on commercial or utility buildings. But there are also many households with flat roofs that require different approach than sloped roofs. The main mounting system used on flat roofs is known as the Flat Roof Ballasted Racking System.

What is the Sun approach angle for a ballasted roof mount?

The sun approach angle of the Ballasted Roof Mount system varies depending upon the amount of ballast required for your installation and whether or not Wind Deflectors are utilized. The sun approach angle for most installations will be 17 degrees. The row spacing for this system is 21.97 inches (module to module).

What is a seismic anchor & microinverter bracket?

Seismic Anchor: Secures the Ballast Tray directly to the building structure through roofing material and/or decking. Provides seismic lateral stability for module array. Microinverter Bracket: Attaches to Ballast Tray and secures microinverter. Works with Enphase, SolarEdge and DirectGrid microinverters.
