

Can grid-connected PV inverters reduce oscillations in DC-link voltage?

To address this issue, this paper presents an advanced control approach designed for grid-connected PV inverters. The proposed approach is effective at reducing oscillations in the DC-link voltage at double the grid frequency, thereby enhancing system stability and component longevity.

When is a PV inverter disconnected?

However, the PV inverter is disconnected shortly after 1.5 cycles. In addition to the three-phase PV inverter, in Gonzalez et al. (2018), a single-phase PV inverter (3.2 kVA) is investigated under fault condition when operating with grid-connected functionality.

What is over current protection mechanism in PV inverter?

As previously discussed, the simultaneous injection of peak active power from PVs and reactive power into the grid for voltage support can trigger the over current protection mechanism in PV inverter. The triggering of over current protection will lead to disconnection of inverter from the grid which is unfavourable during LVRT period.

Can a fault current limit a PV inverter?

The technique is developed by combining distance protection and overcurrent protection, and simulation results under different fault conditions show the feasibility of the proposed scheme. According to the authors, the fault current of PV inverters is limited within 1.5 times the rated current in order to avoid damage to the equipment.

Do PV inverters have stability problems on weak grid condition?

In the voltage stability problem, the stability problem caused by reactive power compensation is highlighted in particular. The aim of this paper is to give an overall understanding of the stability problems of PV inverters on weak grid condition and present some directions for future research to support the PV stations develop for large scale.

How to avoid over current in PV inverters during fault-ride-through period?

Hence, to avoid over current in PV inverters during fault-ride-through period, active power curtailment is necessary. The authors have formulated an expression to evaluate pseudo inverter capacity (PIC) for over current limitation as in (25).
$$PIC = \frac{1 - VUF}{u_{base}} \times u^{+} \times S$$
