

Does proficad support photovoltaic circuit diagrams?

ProfiCAD supports the drawing of photovoltaic circuit diagrams. In addition to the common electrical engineering symbols, the library includes symbols such as solar cells, photovoltaic panels, solar collectors, inverters, etc. Should you need more symbols, you can create them in the symbol editor. Some sample drawings (click for full size):

Can PV modules be installed on a flat roof?

The installation of PV modules on flat roofs is an excellent choice, as the modules can be oriented in the best position, but distance of at least 1/2 of the height of the structure should be left between the rows of PV modules in order to avoid mutual shading. When installing PV modules on a flat roof, several aspects should be considered:

What are photovoltaic panels & how do they work?

They are designed for builders constructing single family homes with pitched roofs, which offer adequate access to the attic after construction. It is assumed that aluminum framed photovoltaic (PV) panels mounted on a "post" and rail mounting system, the most common in the industry today, will be installed by the homeowner.

How do you calculate the number of photovoltaic modules?

Multiplying the number of modules required per string (C10) by the number of strings in parallel (C11) determines the number of modules to be purchased. The rated module output in watts as stated by the manufacturer. Photovoltaic modules are usually priced in terms of the rated module output (\$/watt).

How much space does a photovoltaic module occupy?

Photovoltaic modules installed on a sloping roof or facade occupy an area of approximately 8 m²/kWp. Photovoltaic modules installed on the ground or on a flat surface occupy an area of approximately 20 m²/kWp, avoiding shading between the rows of modules.

What is a roof mounted photovoltaic system guidance?

The guidance refers only to the mechanical installation of roof mounted integrated and stand-off photovoltaic systems; it provides best practice guidance on installation requirements and does not constitute fixing instructions.

With this the number of PV modules N modules required can be determined as; $N \text{ modules} = \frac{\text{Total size of the PV array (W)}}{\text{Rating of selected panels in peak-watts}}$. Suppose, in our case the load is 3000 Wh/per day. To know the needed ...
