What is a photovoltaic solar panel?

Photovoltaics, more commonly known as solar panels, are one of the purest and most reliable methods for producing renewable energy. Each panel is composed of photovoltaic cells, which activate when exposed to the sun, absorbing its rays and converting them into clean electricity.

Are building-integrated photovoltaics a viable alternative to solar energy harvesting?

Historically, solar energy harvesting has been expensive, relatively inefficient, and hampered by poor design. Existing building-integrated photovoltaics (BIPV) have proven to be less practical and economically unfeasible for large-scale adoption due to design limitations and poor aesthetics.

How does a semi-transparent photovoltaic system work?

The semi-transparent photovoltaic units are able to absorb solar radiation without blocking natural light from entering the offices, leading to a 28% reduction in energy use. Between the "mosaic" of photovoltaic panels and the inner glass facade are partially enclosed balconies for the employees to enjoy.

What is the difference between solar tiles and photovoltaic panels?

Solar tiles operate identically to the photovoltaic panels that are already widely used in construction. The primary difference between them lies in their assembly: whereas photovoltaic panels are attached to an existing roof, solar tiles are part of the roof's construction from the start, taking the place of regular tiling.

How did Burkett design integrate photovoltaic modules?

As Barton Harris of Burkett Design explained: "to completely integrate the photovoltaic modules in the aesthetics of the facade, not only was the color of the glass carefully chosen to match the color of the surrounding modules but its surface was coated with a similar sheen."
