How do I design a solar hot water & photovoltaic system?

Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future solar hot water and photovoltaic system components. Space requirements and layout for solar water heating and photovoltaic system components should be taken into account early in the design process.

What is a solar water heater system schematic diagram?

A solar water heater system schematic diagram shows the components of the system and the connections between them. It can help guide homeowners in understanding the design of a solar heating system and how it operates. At the core of a solar water heater system are its photovoltaic panels.

How do you design a solar water pumping system?

When designing a solar pumping system, the designer must match the individual components together. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1.

What types of valves are used in solar water pumping systems?

If a solar water pumping system is installed with poly pipe, then the main valves that will exist in the system generally will include a foot valve (or non-return valve) and gate valves. Tables 8 and 9 provides typical K values for gate valves and foot valves that are common in solar water pumping systems.

What size water pipe should a solar water pumping system use?

The designer should initially use pipe that is the same size as the inlets and outlets. The designer then undertakes the frictional loss calculations for that size of water pipes using the known maximum water flow for that solar water pumping system.

Do solar panels need a float switch?

A minimum of IP56 is required and IP66 or higher is preferred. The solar installer shall install all sensors that are recommended by the manufacturer. Water pumping systems that are pumping water into a storage tank generally include a float switch which is installed in the water tank.
