What are the different approaches to solar energy utilization?

Major developments, as well as remaining challenges and the associated research opportunities, are evaluated for three technologically distinct approaches to solar energy utilization: solar electricity, solar thermal, and solar fuels technologies. Much progress has been made, but research opportunities are still present for all approaches.

Can a photovoltaic system reduce power outages?

Their research results show that zero power outages can be achieved at low energy costs, but the system does not use all the solar energy available in the area. Photovoltaic systems analysis refers to the concept of daily battery status to improve reliability while minimizing the possibility of power outages, excess energy, and cost constraints.

Why is solar energy utilization so important?

Because of its unmatched resource potential, solar energy utilization has been the subject of intense research, development, and deployment efforts that have accelerated during the past decade (1).

Can solar energy be used to reduce building energy consumption?

To date, energy consumption in building is approximately 40% of the global energy supply. At the same time, the total built environment has considerable untapped rooftop space, which could be used to harvest solar energy. This solution could also help reduce building energy consumption by providing shading.

What is photovoltaic transportation?

Photovoltaic (PV)-powered transportation is a novel technique to make the most of the sun's energy. Solar energy can be used to power trains, subways, buses, airplanes, vehicles and even roads, and solar transportation is rapidly becoming a leading choice for renewable energy.

What is the contribution of solar energy to global electricity production?

While the contribution of solar energy to global electricity production remains generally low at 3.6%, it has firmly established itself among other renewable energy technologies, comprising nearly 31% of the total installed renewable energy capacity in 2022 (IRENA, 2023).
