What are the risks associated with a commercial solar and wind project?

Risks exist at various stages of the electricity value chain. There is "resource risk" for commercial solar and wind projects--the risk that the sun doesn't shine, or the wind doesn't blow as much as projected, and less electricity is generated than anticipated.

Are solar projects at risk?

For stakeholders that need to forecast solar yield and asset value, observations from recent years provide new information on the risks to solar projects. First, some locations will be more impacted by smoke than others. Intuitively, proximity to wildfire fuel increases risk.

Could solar power be the future of energy?

A 2021 study by the National Renewable Energy Laboratory (NREL) projected that 40% of all power generation in the U.S. could come from solar by 2035. Solar's current trends and forecasts look promising, with photovoltaic (PV) installations playing a major role in solving energy problems like carbon pollution and energy dependence.

Are solar panels a risk?

This is a small risk you'll be taking when installing solar. Solar system components are built to last, and the manufacturer backs this up with solid guarantees and warranties for panels and inverters. Some solar panels even come with warranties that last up to 30 years.

What are some problems with solar panels?

These issues include problems connecting solar to electrical grids, equipment shortages, supply chain delays, a lack of land for commercial solar arrays, and a lack of qualified contractors and laborers to meet installation demands.

Is a poorly installed solar system dangerous?

A poorly installed system could even be dangerous if the electrical work is done incorrectly. However, there are steps you can take to mitigate that risk to ensure you end up with a solar installer that delivers a high-quality, well-installed system that will last for decades.
