What is the emergent typology of multifunctional solar power plants?

This paper presented an emergent typology of multifunctional SPPs. Compared to monofunctional SPPs, the spatial configuration of these solar power plants is adapted to include a variety of functions. The typology consists of four dimensions: energy, economic, nature and landscape.

Why is energy density of multifunctional solar panels lower than regular SPPS?

Often, energy density of multifunctional SPPs is lower compared to regular SPPs that focus only on maximizing electricity production. Attention for the other three dimensions decreases energy density because either available space for PV panels or panel efficiency is reduced.

Are there spatial and temporal gaps between solar and wind resources?

In particular, we assess spatial and temporal gaps between electricity demand and the availability of solar and wind resources, which represent gaps that must be filled by other non-emitting generation technologies or operating strategies in reliable electricity systems based on zero-carbon sources.

Where are the supply gaps in continental-scale solar-wind systems eliminated?

Supplementary Fig. 6 shows that the supply gaps in continental-scale solar-wind systems might be entirely eliminated in Africa, Asia, and South America, and limited to $\leq 2\%$ of demand and 49, 26, and 13 h in Europe, Oceania, and North America, respectively, given excess annual generation of 50% and 12 h of storage.

How does the typology support decision-making processes on solar power plants?

This typology supports decision-making processes on solar power plants and adds to the existing (solar) energy landscape vocabulary. In doing so, the research supports the transformation of energy systems in a way that meets both the quantitative goals and qualitative considerations by society. 1. Introduction

Can excess solar and wind energy be curtailed?

Excess solar and wind energy can be curtailed due to no available storage. 100% reliability results if the solar and wind power supply system can meet all the electricity demand in every hour of the simulation.

sensitivity is accentuated in mountain regions where energy alternatives are limited (Malla 2013) and energy prices are uncertain (Steinbuks and Hertel 2013). Clean energy transitions can ...

Solar power generation is more efficient at higher altitudes, but limitations exist. An increase in solar radiation exposure leads to a higher surface temperature on your panels. ... How Solar Panels Work on Mountains. Getting ...
