

Will solar and wind energy lead the growth in US power generation?

Solar and wind energy will lead the growth in U.S. power generation for at least the next two years, according to EIA estimates. This report uses data from the EIA to analyze solar and wind capacity and generation over the past decade (2014 to 2023) in all 50 states and the District of Columbia.

Where do solar and wind power data come from?

All national and state-level data come from the U.S. Energy Information Administration (EIA). Utility-scale solar and wind summer capacity values for 2014-2022 are as reported in EIA's Historical State Data for each year.

Why is wind prediction error affected by hourly power generation?

The wind prediction error is affected by the hourly power generation because the prediction model is employed based on the irregular hourly wind output. In contrast, the solar prediction error is affected by daily fluctuations since solar generation exhibits daily periodicity.

How to predict wind & solar output based on error-analysis benchmarks?

Error-analysis benchmarks for wind and solar output forecasting are of great value in academic research and industry. First, a prediction error database of the wind and solar output should be obtained via benchmark prediction methods, e.g., neural network-based ²⁵, data mining ²⁶, and regression methods ²⁷.

Why is wind power forecasting irregular?

The reason is that wind power prediction is conducted hour-by-hour, and the daily wind power generation is irregular and cannot reflect the hourly wind generation pattern. Regarding solar power, power generation varies periodically daily, and the characteristics of the hourly first-order difference could be masked by this daily periodicity.

How do we model the output of solar and wind power?

To model the output of Solar and Wind power, the study utilizes the System Advisory Model, incorporating solar data from the National Solar Radiation Database and wind data from the Wind Integration National Dataset Toolkit.

About this report. Renewable power has seen a dramatic expansion in recent years owing to sharply falling costs. But this growth has raised a new challenge for power system operators and regulators. Integrating the first few ...

For Xinjiang province, which has a temperate continental climate, the evaluation indicators of three aspects of photovoltaic power generation system are generally superior to ...

Renewable energy generation technology, as an alternative to traditional coal-fired power generation, is receiving increasing attention. However, the intermittent characteristics of wind ...

This guide highlights the key performance indicators for the power generation industry and where investors should look to find an investment edge. While this guide is not a fully integrated power generation industry primer, as the market ...

The accurate evaluation and fair comparison of wind farms power generation performance is of great significance to the technical transformation and operation and maintenance management of wind farms. ...

Electricity generation from solar and wind power per person. Measured in kilowatt-hours per person. Ember (2024); Energy Institute - Statistical Review of World Energy (2024); Population based on various ...

As a result of new solar projects coming on line this year, we forecast that U.S. solar power generation will grow 75% from 163 billion kilowatthours (kWh) in 2023 to 286 billion kWh in 2025. We expect that wind ...

The cumulative wind and solar power generation for the years 2025-26 is projected to be 1232.3 TW?h and 450.9 TW?h. The SF-SARIMA model is versatile and can be applied to both wind ...

power assets has become a new challenge to be solved by practitioners in the field of wind power. Wind farm power generation performance evaluation is used to quantitatively evaluate the ...

Solar and wind power generation indicators
