

Electricity generation capacity. To ensure a steady supply of electricity to consumers, operators of the electric power system, or grid, call on electric power plants to ...

Most electric power generation systems do not store energy since doing so would be extremely expensive. The utilities must thus utilize more fossil fuel-burning facilities to ramp ...

OverviewComparison between CSP and other electricity sourcesHistoryCurrent technologyCSP with thermal energy storageDeployment around the worldCostEfficiencyConcentrated solar power (CSP, also known as concentrating solar power, concentrated solar thermal) systems generate solar power by using mirrors or lenses to concentrate a large area of sunlight into a receiver. Electricity is generated when the concentrated light is converted to heat (solar thermal energy), which drives a heat engine (usually a steam turbine) connected to an ...

CSP technologies use mirrors to reflect and concentrate sunlight onto a receiver. The energy from the concentrated sunlight heats a high temperature fluid in the receiver. This heat - also known as thermal energy - can be used to spin a ...
