How does structural analysis affect a rooftop solar project?

It can make or break the feasibility of the project or have significant effects on the system size and cost of racking. In this article, Pure Power's in-house structural engineering team shares the high level process involved in the structural analysis of a rooftop solar project.

Does a roof support solar photovoltaic panels or modules?

The structure of a roof that supports solar photovoltaic panels or modules shall be designed to accommodate the full solar photovoltaic panels or modules and ballast dead load, including concentrated loads from support frames in combination with the loads from Section CS507.1.1.1 (IBC 1607.12.5.1) and other applicable loads.

How do I calculate the structural load of solar panels on a roof?

To calculate the structural load of solar panels on a roof, several factors must be considered, including the number and weight of the panels, the weight of the mounting system and components, and any additional loads from wind, snow, or seismic events.

What is structural engineering for a rooftop solar project?

Structural Engineering is a small but critical part of the engineering for a rooftop solar project. It can make or break the feasibility of the project or have significant effects on the system size and cost of racking.

Can solar panels be installed on a sloped roof?

As well, solar panel installations on sloped roofs can act to trap snow that otherwise may have been considered to slide off the roof structure. Finally, roofing systems installed in new buildings are typically designed to outlast or at least match the average life of the new solar PV system which is about 25 years.

What is a roof photovoltaic live load?

The roof photovoltaic live load in areas covered by solar photovoltaic panels or modules shall be in addition to the panel loading unless the area covered by each solar photovoltaic panel or module is inaccessible. Areas where the clear space between the panels and the rooftop is not more than 24 inches (610 mm) shall be considered inaccessible.

For areas that experience snow, snow loads on solar panel should also be considered. To calculate snow loads for our solar panel, we will be using Chapter 7 of ASCE 7-16. We will be consider the solar panel structure ...
