

Surface spraying of photovoltaic bracket assembly

What is a photovoltaic mounting system?

Photovoltaic mounting systems (also called solar module racking) are used to fix solar panels on surfaces like roofs, building facades, or the ground. [1] These mounting systems generally enable retrofitting of solar panels on roofs or as part of the structure of the building (called BIPV). [2]

What factors should be considered when applying photovoltaic coatings?

When applied to photovoltaic modules, it is crucial to consider the factors such as self-cleaning, transparency, anti-reflection, anti-icing, and durability. In future research, it is significant to improve the transparency, durability, and self-cleaning properties of coatings.

How to choose the best coating thickness for photovoltaic modules?

The coating is superhydrophobic, with a contact angle of approximately 159° ; and a transmittance of 85% (Fig. 12). Thus, when applied to photovoltaic modules, the best coating thickness can be obtained by controlling the number of coating layers. This method is easy to implement and cost-effective.

Which method is suitable for self-cleaning coating of photovoltaic modules?

The preparation methods suitable for self-cleaning coating of photovoltaic modules include LBL, CVD, sol-gel method, and plasma-etching technology. LBL, CVD and sol-gel technologies are all CVD-based surface treatment technologies, which have difficulty in precision control. Sol-gel method and LBL are both economical.

Why do photovoltaic panels need a transparent coating?

When sunlight shines on the photovoltaic panel, part of the visible light will be reflected, and the rest will be converted and utilized. Therefore, the transparency and anti-reflection of the self-cleaning coatings applied on photovoltaic modules cannot be ignored.

Which surface treatment is suitable for preparing photovoltaic self-cleaning surfaces?

CVD-based surface treatment is suitable for preparing photovoltaic self-cleaning surfaces. These methods prepare self-cleaning surfaces by reacting gaseous substances with hot surfaces and depositing them on the surface. They are efficient but difficult to control accuracy.

water spray on the surface of the photovoltaic panel compared to a 2 mm diameter nozzle. This is what makes the cooling results with a nozzle diameter of 2 mm more optimal for each. 15.
