

# The cost of wind power generation per kilowatt-hour

How much does a wind power system cost?

The installed capital costs for wind power systems vary significantly depending on the maturity of the market and the local cost structure. China and Denmark have the lowest installed capital costs for new onshore projects of between USD 1 300/kW and USD 1 384/kW in 2010.

How much does a wind turbine cost?

As illustrated, the costs range from approximately 7-10 cEUR/kWh at sites with low average wind speeds, to approximately 5-6.5 cEUR/kWh at windy coastal sites, with an average of approximately 7cEUR/kWh at a wind site with average wind speeds.

How much does a wind farm cost?

The LCOE of typical new onshore wind farms in 2010 assuming a cost of capital of 10% was between USD 0.06 to USD 0.14/kWh. The higher capital costs offshore are somewhat offset by the higher capacity factors achieved, resulting in the LCOE of an offshore wind farm being between USD 0.13 and USD 0.19/kWh assuming a 10% cost of capital.

What factors affect the cost of energy produced by a wind turbine?

The turbine's power production is the single most important factor for the cost per unit of power generated. The profitability of a turbine depends largely on whether it is sited at a good wind location. In this section, the cost of energy produced by wind power will be calculated according to a number of basic assumptions.

What are the capital costs of a wind power project?

The capital costs of a wind power project can be broken down into the following major categories: Source: Blanco, 2009. Wind turbine costs include the turbine production, transportation and installation of the turbine. Grid connection costs include cabling, substations and buildings.

What is the average load factor for a new wind project?

This is based on the assumption that the typical load factor in Europe for new projects in 2011 was in the range of 25% to 30% for onshore projects (IEA Wind, 2011).<sup>24</sup> The cost reductions assumed by 2015 reduce the LCOE of wind by between 6% and 7% for a given capacity factor.

For newly commissioned onshore wind projects, the global weighted average LCOE fell by 5% between 2021 and 2022, from USD 0.035/kWh to USD 0.033/kWh; whilst for utility-scale solar PV projects, it decreased by 3% year ...

The calculated costs per kWh of wind-generated power, as a function of the wind regime at the chosen sites, are shown in Figure 1.8. As illustrated, the costs range from approximately 7-10 cEUR/kWh at sites with low

# The cost of wind power generation per kilowatt-hour

average wind speeds, ...

The average installed cost of wind projects in 2021 was \$1,500/kW, down more than 40% since the peak in 2010. Lower installation costs lead to energy produced at a lower cost, with the average levelized cost of ...

With the assumed moderate emission costs of USD 30/tCO<sub>2</sub> their costs are now competitive, in LCOE terms, with dispatchable fossil fuel-based electricity generation in many countries.<sup>2</sup> In particular, this report ...

estimated life of the asset. It represents the average revenue per unit of electricity. The calculation uses discounted cashflow to estimate the net present value of the overall generation costs ...

The average cost per unit of energy generated across the lifetime of a new power plant. This data is expressed in US dollars per kilowatt-hour. It is adjusted for inflation but does not account for differences in the cost of living between ...

So add the doubled cost of Nat Gas power for, say, 16 hours per day with the cost of renewable power for 6 to 8 hours per day and you would get closer to the real cost. ... Texas has seen incredible growth in its wind generation installed ...

In Figure 1.9, the costs per kWh of wind-produced power are shown as a function of the wind regime and the discount rate (which varies between 5 and 10 per cent per annum). Figure 1.9: The Costs of Wind-Produced Power as a Function of ...

The global weighted average levelised cost of electricity (LCOE) of new onshore wind projects added in 2021 fell by 15%, year-on-year, to USD 0.033/kWh, while that of new utility-scale solar PV fell by 13% year-on-year to USD 0.048/kWh ...

As such it proves that tidal has a very long life expectancy, while wind turbines for example currently only last for around 20 years. La Rance cost \$115m and the time of construction, which adjusted for inflation is \$918m in ...
