What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

Do solar panels have higher power ratings?

Despite the publicity around the many high-powered panels, the PV cell advancements enabling these higher power ratings are universal. Thanks to these innovations, regular-size commercial and residential solar panels have also increased in power significantly, with 400W to 550W panels now standard.

What is a PV panel?

PV cells are electrically connected in a packaged, weather-tight PV panel (sometimes called a module). PV panels vary in size and in the amount of electricity they can produce. Electricity-generating capacity for PV panels increases with the number of cells in the panel or in the surface area of the panel.

Why do 72-cell solar panels have higher power output than 60-cell panels?

72-cell panels can have higher wattages and power output than 60-cell panels because of the additional photovoltaic cells, but that's not always the case. In fact, the number of cells in a panel doesn't have a direct correlation to its power output.

How many PV panels are in a PV array?

A PV array can be composed of as few as two PV panels to hundreds of PV panels. The number of PV panels connected in a PV array determines the amount of electricity the array can generate. PV cells generate direct current (DC) electricity. DC electricity can be used to charge batteries that power devices that use DC electricity.

Why is the solar PV panel market so competitive?

The high level of competition in the solar PV panel market, mainly due to the future market demand in and the competitiveness of leading countries, is compounded by the fact that transporting solar energy equipment is less cumbersome than transporting other renewable technologies (such as wind).
