

# The necessity of smart microgrids

Why do we need a smart grid and a microgrid?

The competitive landscape among energy providers and distributors has empowered consumers to not only save money on their energy bills but also incorporate sustainable energy sources into the grid. To efficiently manage electricity distribution, deregulated power systems must include a smart grid and microgrid (MG).

Why do microgrids need a sophisticated energy management system?

Microgrids require a sophisticated energy management system to ensure that energy is being used efficiently and effectively, and that the flow of energy is balanced between generation and storage. In addition, microgrids must be designed to be flexible and scalable, able to adapt to changing energy needs and requirements.

Why are microgrids important?

Microgrids can also help to support the integration of renewable energy into the main electrical grid, promoting a more sustainable and efficient energy system overall. Thus, microgrids are an important tool in the efforts to create a low carbon future and a more sustainable energy system.

How can microgrids improve energy access?

Improved Energy Access: Microgrids can provide energy access to remote or underserved communities that are not connected to the traditional power grid. This can improve the quality of life for residents and increase economic opportunities in these areas.

How do microgrids support a flexible and efficient electric grid?

Microgrids support a flexible and efficient electric grid by adapting to integrating growing deployments of renewables such as solar farms and electric vehicles. In addition, using local sources of energy to serve local loads helps reduce energy losses in transmission and distribution, further increasing efficiency of the electric delivery system.

Will grid-tied microgrid customers stay connected if the grid fails?

Although grid-tied microgrid customers will likely stay connected to the grid for the foreseeable future, only islanding in the case of utility grid failure, self-consumption of microgrid generated energy could erode the revenue base that has traditionally paid for utility infrastructure investments.
