What is open-circuit voltage in a solar cell?

The open-circuit voltage, V_{OC} , is the maximum voltage available from a solar cell, and this occurs at zero current. The open-circuit voltage corresponds to the amount of forward bias on the solar cell due to the bias of the solar cell junction with the light-generated current. The open-circuit voltage is shown on the IV curve below.

How do surface polar molecules contribute to high open-circuit voltage in perovskite solar cells?

To date, the improvement of open-circuit voltage (VOC) offers a breakthrough for the performance of perovskite solar cells (PSCs) toward their theoretical limit.

Does open-circuit voltage increase increase efficiencies in ternary organic photovoltaics?

Zhan, L. et al. Desired open-circuit voltage increase enables efficiencies approaching 19% in symmetric-asymmetric molecule ternary organic photovoltaics. *Joule* 6,662-675 (2022). Zhu, L. et al. Single-junction organic solar cells with over 19% efficiency enabled by a refined double-fibril network morphology. *Nat.*

What is open-circuit voltage?

Open-circuit voltage is then a measure of the amount of recombination in the device. Silicon solar cells on high quality single crystalline material have open-circuit voltages of up to 764 mV under one sun and AM1.5 conditions 1, while commercial silicon devices typically have open-circuit voltages around 690 mV.

What does VOC mean on a solar panel?

VOC is the maximum voltage of an open circuit produced by a solar panel. Open Circuit Voltage (VOC) and is a product of the forward biases of the solar cell. You cannot go by the volts rating on the solar panel box because a 12v solar panel will produce as much as 18v-22v. However, you can use a voltmeter to test the actual voltage.

How do you determine the voltage of a silicon solar cell?

Silicon solar cells on high quality single crystalline material have open-circuit voltages of up to 764 mV under one sun and AM1.5 conditions 1, while commercial silicon devices typically have open-circuit voltages around 690 mV. The V_{OC} can also be determined from the carrier concentration 2: $V_{OC} = k T q \ln \left[\frac{N_A + D_n}{n_i^2} \right]$
